

- Max has an initial plan for two workstreams this summer which he will develop in more detail
 - #1: apply metrics for regenerative potential once developed (non-profit project)
 - #2: propose optimal development plan for the ranch, especially the remaining 25-30 acres of dying lemons/unused land (profitability; water requirements; potential / ease of growing regenerative; labor requirements; cost / feasibility of hiring a FT farm manager to work alongside armando vs. continuing work with Becker Studios, the developer who currently manages farm from a distance)
 - A flexible approach may be beneficial as opportunities may become apparent as you work through the summer & it may be worth evaluating the highest impact work as summer progresses
- Max to plan a visit to farm at optimal time for data collection, ranch understanding, and meetings with relevant stakeholders
 - Giuseppe (Index Fresh avocado packing house contact)
 - Armando (ranch hand/manager)
 - Visit a few farmers markets to better understand local market
 - Consider Touring a regenerative farm or two (Apricot Lane Farm; Rincon Hill Farm)
- TO DO: Select a date to visit sooner rather than later so that we can book airline ticket & accommodation near the farm (are you able to get a rental car if you're traveling solo?)

Productivity analysis:

- What to do with dying lemon crop
- economically viable and regen agriculture good crops
- 45 acres avocado
- 4500 trees
- What to do with the remaining 25 acres on the farm

Avacodo:

- 13 blocks → which block needs more water - irrigation analysis
-
